Reflection

This project was really interesting in many ways, and through all the trials and tribulations I feel like it was a worthy class. I had a lot of issues with motivation over the course of this class, because almost all of the work was completely self-driven and other than pinups there was almost no collaboration whatsoever with the class. This could have been solved using different ways of time-management, or simply allowing for more time in class to work on things to allow for more outside influence. I believe that, with the proper parts and more foreplanning, that the form of the product would have been exactly what it needed to be, but the function would need work on multiple angles. The function in regards to software would be greatly helped by simply breaking apart all of the pieces and then finding a way to put them all together, instead of trying to modify a large chunk of code that can get confusing when it starts getting to 6 or more tabs and hundreds of lines.
